PROBLEMS addressed by this Project:

❖ End consumers of Agri-food industry, can not feed their dependents, **without physical presence in kitchen** (as raw items needs to be processed for dependent's to consume)

❖ Today consumers prepare quantity / quality of food by individual judgement so, extra food prepared **gets wasted**. Leaving other part of the world hungry.

❖ End consumers, like to eat **variety of healthy and tasty food with high quality**, but can not prepare it, due to **lack of expertise** and know how about recipe to prepare such food items. In fact there is no mechanism to prepare the food of individual's choice and understand their food habits and schedules.

❖ Lots of productive time of working community, is spent in preparing fresh food items, specifically after exhausted working day it is not easy to spend time in kitchens. **Freshly prepared** food of indivisual choice without any efforts, at any given instance of time **(24 X 7) is always a dream for this community.**

❖ Large part of **society is reaching to old age**, and this situation will result in **limited physical activities,** like daily preparing the ready to eat fresh food for,
  ❖ End consumers of Agri-food industry T**hemselves**
  ❖ Their dependent **loved** ones. (e.g. Husband, Wife, kids, Mother, Father, Friends)
  ❖ Their valuable **customers (** e.g. Typically Restaurants businesses providing processed fresh food for customers, depends heavily on Chefs)

❖ **Next generation has limited interest and time** for preparing fresh food on their own, **due to digital lifestyles**.
  ❖ This causes health issues and **long term health impacts later in life**.
  ❖ The situation also leads to, development of **irregular and unhealthy eating habits**.
  ❖ Considering these lifecycle constraints there is an urgent need of solution to create superior value from quality Agri-food output.

❖ Potential of technology is "**under utilized in our kitchens"**, and all stakeholders have expectations from industry4.0 and technology to bring innovative solution to society. Typically old aged persons, chefs and customers of restarants, travelling and working professionals, working mothers and many others.

- Not every End consumers of Agri-food industry can prepare the food item of his/her choice even after lots of efforts -

More About us : The Institution and Research areas

The Institution:

Finite Telemetry Innovations is based in Nürnberg, Germany. Finite Telemetry Innovations is founded by Mandar Balaji Kulkarni with a strategic long-term vision. The core values of his vision are Customer Success, Trust, Agility, Partnerships and Digitalization. We are fast growing innovative organisation dedicated to connect future technologies with businesses.

Our Research areas :

Our business is to help our customer succeed in achieving their business Digitalization and Transformation objectives.
Other than acquiring know-how and expertise on Robotics, we map business with technology areas including ,
PLM
Internet of Things (IoT) & Industry 4.0
Cloud, Artificial Intelligence,development and further extending to Future technologies.

We are seeking partner to succeed together :

Currently, we are focused on development of **TheUltimateChef.**

Further we are looking forward for securing funding, to take this product to the market.
